

**Def.** Absolute value.

The absolute value function is  $|\cdot| : \mathbb{R} \rightarrow [0, \infty)$ ,

$$x = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$$

Note that if  $x, y \in \mathbb{R}$ , then the *distance* from  $x$  to  $y$  is  $|x - y|$ .

Note that  $|x| < a \Leftrightarrow -a < x < a \Leftrightarrow x \in (-a, a)$ .

And finally, for all  $x, y \in \mathbb{R}$ ,  $|x + y| \leq |x| + |y|$ .

## LIMITS

**Goal:** Determine the behaviour of a function  $f$  near the point  $c$ , without ever evaluating  $f(c)$ .

*There is a weird-point graph and Canyon-geologist analogy.*

**Def.** Deleted open interval.

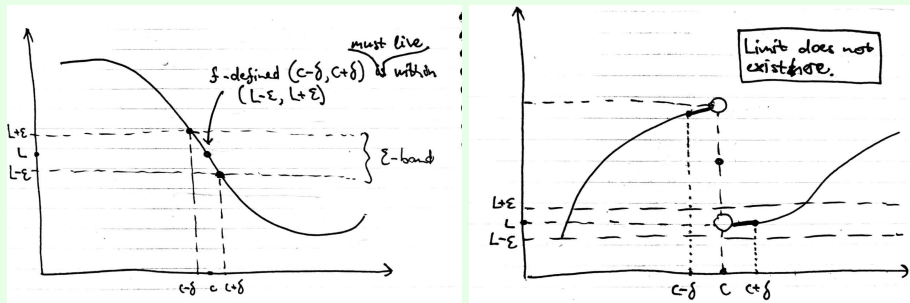

Suppose  $f : D \rightarrow \mathbb{R}$  is a function,  $c \in \mathbb{R}$ , and  $f$  is defined on a deleted open interval around  $c$ . (There exists some  $\rho > 0$  such that  $f$  is defined on  $(c - \rho, c) \cup (c, c + \rho)$ .)

We say that  $\lim_{x \rightarrow c} f(x) = L$  if for every  $\varepsilon > 0$ , there exists a  $\delta > 0$  such that for all  $x \in \mathbb{R}$  satisfying  $0 < |x - c| < \delta$  then  $|f(x) - L| < \varepsilon$ .

To paraphrase that statement:

$$\lim_{x \rightarrow c} f(x) = L \Leftrightarrow (\forall \varepsilon > 0)(\exists \delta > 0)(\forall x \in \mathbb{R})[0 < |x - c| < \delta \Rightarrow |f(x) - L| < \varepsilon]$$

1. Given an "error bound" ( $\varepsilon$ ),
2. we can always find some distance ( $\delta$ ) such that
3. if we are no more than that distance away from  $c$
4. then our approximation is within that error bound.

## Problem

Show that  $\lim_{x \rightarrow 4} [2x + 3] = 11$ .

**Solution.**

Let  $\varepsilon > 0$  be given, and set  $\delta = \frac{\varepsilon}{2}$ . Suppose then that  $0 < |x - 4| < \delta$ , then

$$|[2x + 3] - 11| = |2x - 8| = 2|x - 4| < 2\delta = 2 \cdot \frac{\varepsilon}{2} = \varepsilon$$

**Strategy for solving Limits**

$$(\forall \varepsilon > 0)(\exists \delta > 0)(\forall x \in \mathbb{R})[0 < |x - c| < \delta \Rightarrow |f(x) - L| < \varepsilon]$$

- This  $(\varepsilon)$  should be arbitrary.
- We get to choose  $\delta$ , it should depend on  $\varepsilon$ .

**Goal:** Write  $|f(x) - L| \leq M \cdot |x - c|$  for some  $M > 0$ . At this point, take  $\delta = \frac{\varepsilon}{M}$

$$|f(x) - L| \leq M|x - c| < M\delta = M \cdot \frac{\varepsilon}{M} = \varepsilon$$

**Problem**

Show that  $\lim_{x \rightarrow (-1)} [5 - 4x] = 9$ .

**Solution. (Rough work)**

$$|f(x) - L| = |[5 - 4x] - 9| = |-4x - 4| = 4|x + 1| = M \cdot |x - c|$$

**Solution. (Real proof)**

Let  $\varepsilon > 0$  be given, and set  $\delta = \frac{\varepsilon}{M} = \frac{\varepsilon}{4}$ . Suppose then that  $0 < |x - c| = |x + 1| < \delta$ , then

$$|[5 - 4x] - 9| = |-4x - 4| = 4|x + 1| < 4\delta = 4 \cdot \frac{\varepsilon}{4} = \varepsilon$$

□

**Problem**

Show that  $\lim_{x \rightarrow 1} [2x^2 + 1] = 3$ .

**Solution. (Rough work)**

$$|f(x) - L| = |[2x^2 + 1] - 3| = |2x^2 - 2| = 2|x^2 - 1| = 2|x - 1||x + 1| < M|x - 1|$$

We will have to assume  $|x - 1| < 1$ , i.e.  $\delta \leq 1$ .

$$|x - 1| < 1 \Rightarrow |x + 1| \leq |x - 1| + |2| < 3$$

So we set  $\delta = \frac{\varepsilon}{6}$ .

$$|f(x) - L| = 2|x - 1||x + 1| < 6|x - 1| = M|x - 1|$$

**Solution. (Real proof)**

Let  $\varepsilon > 0$  be given, and set  $\delta = \min(1, \frac{\varepsilon}{6})$ . Suppose then that  $0 < |x - c| < \delta$ . Since  $|x - 1| < \delta$  then  $|x + 1| < 3$  by (\*). Thus,

$$|[2x^2 + 1] - 3| = 2|x - 1||x + 1| < 6|x - 1| < 6\delta \leq 6 \cdot \frac{\varepsilon}{6} = \varepsilon$$

□

**Problem**

Show that  $\lim_{x \rightarrow 3} \sqrt{x+1} = 2$ .

**ONE-SIDED LIMIT**

Suppose that  $f : D \rightarrow \mathbb{R}$  and  $c \in \mathbb{R}$ . If  $f$  is defined on some interval  $(c, c+e)$ ,  $e > 0$ , then we say that  $\lim_{x \rightarrow c^+} f(x) = L$  if  $(\forall \varepsilon > 0)(\exists \delta > 0)(\forall x \in \mathbb{R})[x \in (c, c+\delta) \Rightarrow |f(x) - L| < \varepsilon]$ .

Immediately,  $\lim_{x \rightarrow c} f(x) = L \Leftrightarrow \lim_{x \rightarrow c^+} f(x) = L = \lim_{x \rightarrow c^-} f(x)$

**Problem**

Show that  $\lim_{x \rightarrow 0^+} \frac{x}{|x|} = 1$ .

**Solution.**

Let  $\varepsilon > 0$  be given and set  $\delta = \varepsilon$ . Note that if  $x \in (0, \delta)$  then  $x > 0$  so  $|x| = x$ , and so

$$|f(x) - L| = \left| \frac{x}{|x|} - 1 \right| = |1 - 1| = 0 < \varepsilon$$

□

**HORIZONTAL ASYMPTOTE**

A function  $f$  has a horizontal asymptote at  $L$  if either  $\lim_{x \rightarrow \infty} f(x) = L$  or  $\lim_{x \rightarrow -\infty} f(x) = L$ .

**Def.** "Limit to infinity".

Suppose  $f : D \rightarrow \mathbb{R}$  is defined on  $(a, \infty)$  for some  $a \in \mathbb{R}$ . We say that  $\lim_{x \rightarrow \infty} f(x) = L$  if

$$(\forall \varepsilon > 0)(\exists M \in \mathbb{R})(\forall x \in \mathbb{R})[x > M \Rightarrow |f(x) - L| < \varepsilon].$$

For all  $\varepsilon > 0$ , there is some point  $M$  after which the function stays entirely in an epsilon band.

**Problem**

Show  $\lim_{x \rightarrow \infty} \frac{x^2}{x^2+1} = 1$ .

**Solution. "Rough work"**

$$|f(x) - L| = \left| \frac{x^2}{x^2+1} - 1 \right| = \left| \frac{x^2 - x^2 - 1}{x^2+1} \right| = \left| \frac{-1}{x^2+1} \right| = \frac{1}{x^2+1}$$

We want  $\frac{1}{x^2+1} < \varepsilon$  or  $x^2+1 > \frac{1}{\varepsilon}$ , so  $x > \sqrt{\frac{1}{\varepsilon} - 1}$ .

This works so long as  $0 < \varepsilon < 1$ .

In the proof, do cases. [If  $\varepsilon > 0$  take  $M = 0$ .] [If  $0 < \varepsilon < 1$  take  $M = \sqrt{1/\varepsilon - 1}$ .]

**Def.**  $\lim_{x \rightarrow \infty} f(x) = \infty$ .

$$(\forall N \in \mathbb{R})(\exists M \in \mathbb{R})(\forall x \in \mathbb{R})[x > M \Rightarrow f(x) > N]$$
